

## FinTrust Digital Bank

### Week 4 - Part C: Final Power BI Dashboard Review

Final testing, refinement and user-experience validation

**Purpose:** This document records the final Week 4 review of the FinTrust Power BI dashboard. It documents the tests performed, findings observed, refinements made, re-testing completed and the final readiness of the dashboard for submission and presentation.

#### 1. Final Dashboard Structure

The final Power BI solution builds on the Week 3 dashboard and includes the following pages:

- KPI section
- Customer Analysis
- Transaction Analysis
- Risk-Review Analysis

#### 2. Final Power BI Test Summary

| Test | Area Reviewed                  | Outcome                                                                                                 | Status |
|------|--------------------------------|---------------------------------------------------------------------------------------------------------|--------|
| C1   | KPI accuracy                   | Core KPI cards matched the validated final dataset values.                                              | Passed |
| C2   | Slicers and interactions       | Customer Segment, Channel and Transaction Date slicers and chart interactions worked as intended.       | Passed |
| C3   | Visual clarity and consistency | Titles, labels, formatting, alignment and page layout were reviewed and refined.                        | Passed |
| C4   | Final user experience          | Dashboard navigation, filtering, interactions and readability were tested from an end-user perspective. | Passed |

#### 3. C1 - KPI Accuracy Test

**Test:** Compared the six core Power BI KPI cards with KPI values recalculated directly from the final cleaned datasets in Python.

**Finding:** The dashboard values matched the validated final dataset: Total Customers = 1,500; Total Transactions Processed = 12,000; Total Transaction Value = approximately NGN 560.48M; Average Transaction Value = approximately NGN 46,706.45; Transaction Success Rate = 90.47%; Risk Review Rate = 19.60%.

**Refinement:** No calculation correction was required. Display formatting was reviewed for consistency and readability.

**Re-test:** The KPI cards were checked again after the formatting review.

**Final Result:** Passed - the core Power BI KPI calculations are accurate and consistent with the final dataset.

#### 4. C2 - Slicer and Interaction Test

**Test:** Tested the Customer Segment, Channel and Transaction Date slicers and checked cross-filtering between relevant dashboard visuals.

**Finding:** The slicers correctly filtered the relevant KPI cards and charts, and clearing the slicers restored the overall dashboard values.

**Refinement:** Visual interactions were reviewed to ensure that filters affected the intended visuals without creating confusing behaviour.

**Re-test:** Each slicer and selected chart interaction was tested again after the interaction review.

**Final Result:** Passed - dashboard filtering and interaction behaviour works as intended.

#### 5. C3 - Visual Clarity and Consistency Review

**Test:** Reviewed all Power BI pages for visual clarity, chart titles, labels, percentage and currency formatting, alignment, spacing and overall consistency.

**Finding:** Dashboard pages were clear and readable, with consistent KPI presentation, understandable chart titles and appropriate data labels.

**Refinement:** Minor formatting and alignment adjustments were made where necessary, including cleaner chart titles, exact KPI display values where appropriate, consistent NGN/percentage presentation, and improved spacing on the Segment Detail page.

**Re-test:** All pages were reviewed again after the formatting adjustments.

**Final Result:** Passed - the final dashboard is visually consistent, clearly labelled and presentation-ready.

#### 6. C4- Final User Experience Review

**Test:** Reviewed the complete dashboard from a final-user perspective, including page navigation, slicers, visual interactions and overall readability.

**Finding:** The dashboard was easy to navigate and the main customer, transaction, trend, operational and risk-review insights were clearly communicated.

**Refinement:** Page layout, visual placement and navigation were reviewed to keep the dashboard informative without overcrowding the pages.

**Re-test:** The full dashboard was reviewed again from the KPI Section through the Customer Segment Detail page.

**Final Result:** Passed - the final Power BI dashboard is functional, understandable and ready for submission and presentation.

## 8. Key Refinements Made During Final Review

- Validated the six core KPI cards against Python recalculations from the final cleaned datasets.
- Confirmed that slicers and cross-filter interactions work correctly and restore overall totals after clearing filters.
- Improved the Segment Detail page with segment-level KPI cards and supporting detail charts.
- Reviewed titles, labels, spacing, data labels, currency display and percentage formatting across the dashboard.
- Kept the dashboard focused by avoiding unnecessary additional visuals on already crowded pages.

## 9. Final Part C Conclusion

**Final status: PASSED - READY FOR FINAL SUBMISSION**

The final Power BI dashboard satisfies the Week 4 review focus on KPI accuracy, transaction and customer analysis, trends, channel and status reporting, risk-related patterns, filters/slicers, visual clarity, consistency and user experience. Testing confirmed that the dashboard works as intended and that the key values remain consistent with the validated analytical outputs from Python and SQL.
