

FinTrust Digital Bank

Week 4 - Part D: Final Business Insights

Purpose. This document presents the final business insights from the FinTrust Data Analytics track. Each insight follows the required Week 4 structure: Finding -> Evidence -> Business Meaning -> Recommended Action. The insights consolidate the strongest results from the final SQL, Python and Power BI analyses and translate them into management-relevant actions.

1. Monthly transaction performance weakened in February and recovered in March

Finding	FinTrust experienced a decline in transaction activity in February 2026 followed by a strong recovery in March.
Evidence	January recorded 4,133 transactions worth NGN 188.49M. February declined to 3,734 transactions worth NGN 175.79M. March recovered to 4,133 transactions worth NGN 196.20M.
Business Meaning	The February decline shows that transaction activity can change noticeably from month to month. March returned to January's transaction volume but generated greater transaction value, indicating stronger value performance.
Recommended Action	Monitor month-over-month transaction volume and value and investigate significant changes by channel, transaction type and customer segment.

2. Higher-value transactions receive substantially more risk-review attention

Finding	Risk-review rates rise as transaction values increase.
Evidence	Risk-review rates were 17.66% below NGN 10K, 17.81% for NGN 10K-49,999, 18.95% for NGN 50K-99,999, 22.13% for NGN 100K-199,999 and 40.54% for NGN 200K and above.
Business Meaning	High-value transactions are much more likely to be selected for additional review, particularly above NGN 200,000.
Recommended Action	Maintain enhanced review attention for high-value transactions while periodically assessing whether review thresholds remain operationally appropriate.

3. Transaction failures are concentrated in specific channel and transaction-type combinations

Finding	Failure rates are not evenly distributed across banking channels and transaction types.
Evidence	The highest observed failure rates included POS + Bill Payment at 7.22%, USSD + Transfer at 7.20%, POS + Deposit at 6.34% and Web + Bill Payment at 6.28%. Mobile App + Transfer had a lower percentage failure rate of 6.09% but generated 93 failed transactions because of its higher volume.
Business Meaning	Overall failure rates can hide operational problems within specific services. Both failure percentage and absolute failure count matter when assessing operational impact.
Recommended Action	Monitor failures at the Channel x Transaction Type level and prioritize combinations showing either unusually high failure rates or large numbers of failed transactions.

4. Customer segment size can hide differences in per-customer performance

Finding	The segment producing the highest overall activity is not necessarily the strongest on a per-customer basis.
Evidence	Everyday customers generated the largest overall activity because they were the largest segment. After normalization, SME generated the highest transaction value per customer at NGN 387,923.02, while Student customers recorded the highest transaction frequency at 8.23 transactions per customer.
Business Meaning	Total transaction value alone may favour larger customer segments and can obscure the contribution of smaller segments.
Recommended Action	Evaluate customer segments using both total KPIs and normalized measures such as Transaction Value per Customer and Transactions per Customer.

Responsible-Use Note

Important: Risk_Review_Flag is a synthetic educational review indicator. It should not be interpreted as confirmed fraud, financial crime, or a production risk decision. FinTrust is a fictional organisation and the datasets used in this project are synthetic.

Final Business Insights Summary

The final FinTrust analysis identified meaningful differences in monthly performance, risk-review behavior, transaction failures and customer segment performance. These findings were supported by SQL, Python and Power BI analysis and translate directly into management actions focused on performance monitoring, operational reliability, risk-review prioritization and customer segmentation.
