

Data Analytics Track | Develop & Integrate

Purpose

This KPI analysis documents the key performance indicators used to evaluate FinTrust customer activity, transaction performance and risk-review behaviour in Week 3. It extends the Week 2 summary KPIs by adding normalized, trend-based and operational measures that support more decision-oriented analysis. All results are based on the synthetic FinTrust training dataset.

1. Core KPI Summary

| KPI                       | Week 3 Value  | Definition                                                      | Business Interpretation                                                                                                                    |
|---------------------------|---------------|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Total Customers           | 1,500         | Distinct customers represented in the cleaned customer dataset. | Establishes the size of the customer base used throughout the analysis.                                                                    |
| Total Transactions        | 12,000        | Distinct transactions recorded from January to March 2026.      | Provides the overall transaction activity base for all rate and trend calculations.                                                        |
| Total Transaction Value   | NGN 560.48M   | Sum of transaction amounts across the three-month period.       | Shows the total monetary value processed in the analysis period.                                                                           |
| Average Transaction Value | NGN 46,706.45 | Total transaction value divided by total transactions.          | Provides the typical transaction value at portfolio level.                                                                                 |
| Transaction Success Rate  | 90.47%        | Share of transactions with Successful status.                   | Indicates that most transactions were completed successfully, while failures, reversals and pending transactions form the remaining share. |
| Risk Review Rate          | 19.60%        | Share of transactions marked Risk_Review_Flag = Yes.            | Measures review-selection frequency. The flag is a synthetic review indicator and is not evidence of confirmed fraud.                      |

**Overall KPI interpretation.** The portfolio shows high transaction completion, with a 90.47% success rate, while approximately one in five transactions is selected for risk review. The NGN 560.48M total transaction value and NGN 46.7K average transaction value provide the baseline against which the deeper Week 3 segment, trend and risk metrics were evaluated.

## 2. Trend KPIs

| Month         | Transactions | Transaction Value | Month-over-Month Interpretation           |
|---------------|--------------|-------------------|-------------------------------------------|
| January 2026  | 4,133        | NGN 188.49M       | Baseline month                            |
| February 2026 | 3,734        | NGN 175.79M       | Volume -9.65%; value -6.74% vs January    |
| March 2026    | 4,133        | NGN 196.20M       | Volume +10.69%; value +11.61% vs February |

The monthly KPIs show a clear February slowdown followed by a strong March recovery. March returned to the same transaction count as January but generated a higher transaction value, indicating stronger value performance after the February decline.

## 3. Customer and Segment KPIs

| Customer Segment | Customers | Transactions per Customer | Transaction Value per Customer |
|------------------|-----------|---------------------------|--------------------------------|
| SME              | 216       | 7.90                      | NGN 387,923.02                 |
| Student          | 278       | 8.23                      | NGN 386,603.84                 |
| Everyday         | 711       | 7.94                      | NGN 367,734.07                 |
| Premium          | 295       | 8.00                      | NGN 365,258.29                 |

**Key interpretation.** Everyday is the largest segment, but normalized KPIs reveal a different picture. SME customers generate the highest transaction value per customer, while Student customers have the highest transaction frequency per customer. This supports using normalized KPIs alongside overall totals when comparing segments.

## 5. Operational and Risk KPIs

| KPI / Indicator                         | Category              | Value                  | Business Meaning                                                                     |
|-----------------------------------------|-----------------------|------------------------|--------------------------------------------------------------------------------------|
| Highest failure-rate combination        | POS + Bill Payment    | 7.22%                  | Highest observed failure propensity among channel and transaction-type combinations. |
| Second-highest failure-rate combination | USSD + Transfer       | 7.20%                  | Another combination requiring closer operational monitoring.                         |
| Largest absolute failed count noted     | Mobile App + Transfer | 93 failed transactions | Shows why failure count should be monitored alongside failure rate.                  |
| Risk review: Below NGN 10K              | Below 10K             | 17.66%                 | Lower-value transactions have a materially lower                                     |

| KPI / Indicator                 | Category          | Value                                 | Business Meaning                                                                                   |
|---------------------------------|-------------------|---------------------------------------|----------------------------------------------------------------------------------------------------|
|                                 |                   |                                       | review rate.                                                                                       |
| Risk review: NGN 200K+          | 200K and Above    | 40.54%                                | High-value transactions are much more frequently selected for review.                              |
| Top 10% high-value transactions | Top 10% by amount | 36.00% risk review;<br>91.42% success | High-value transactions receive more review attention while still maintaining a high success rate. |

**Risk interpretation note.** Risk\_Review\_Flag is a synthetic educational review indicator. A higher review rate means transactions were more frequently selected for review; it must not be interpreted as a confirmed fraud rate.

## 7. KPI Analysis Conclusion

The Week 3 KPI framework provides a more complete view of FinTrust performance than portfolio totals alone. Core KPIs establish the overall customer, transaction, value, success and review position; trend KPIs reveal the February decline and March recovery; and operational/risk KPIs identify specific failure and review patterns. Together, these measures support the Week 3 objective of producing a more decision-oriented business intelligence solution.
